Analysis and Comments	Result	Units	Reporting Limit	Notes
MDA is a metabolite of MDMA and methylenedioxyethylamphetamine (MDEA) and is abused for its central nervous system stimulant and hallucinogenic properties.				
MDMA	500	ng/mL	50	
Synonym(s): 3,4-Methylenedioxymethamphetamine; Ecstasy				
MDEA	500	ng/mL	50	
Synonym(s): 3,4-methylenedioxyethylamphetamine; Eve				
3,4-methylenedioxyethylamphetamine (MDEA) is a sympathomimetic compound with mixed stimulant, and hallucinogenic properties. Users report that MDEA promotes empathy, and feelings of love, or emotional closeness to others. Users also report visual and tactile hallucinations, confusion, agitation, and coma. Acutely, users typically have elevated pulse and blood pressure, and dilated pupils, with slow reaction to light. The mixed stimulant and hallucinogenic effects of recreational use of this drug create a risk for impairment of the skills needed for safe driving.				

This test was developed and its performance characteristics determined by NMS Labs. It has not been cleared or approved by the US Food and Drug Administration.
